DOE Hydrogen Program

Annual Merit Review

Washington, DC

June 8, 2010

Project ID: ST006

This presentation does not contain any proprietary, confidential, or otherwise restricted information

Overview

Timeline

- Start: February 2009
- End Phase 1: July 2011
- End Phase 2: July 2013
- End Phase 3 / Project: July 2014
- Percent complete: 18.0% (spending)

Budget

- \$6.86M Total Program
 - \$5.32M DOE
 - \$1.55M (22.5%) UTRC
- FY09: \$350k DOE
- FY10: \$870k DOE

Barriers*

- A J
- A. System Weight & Volume
- E. Charging / Discharging Rates
- J. Thermal Management
- Targets*
 - All
- HSECoE Partners

LIGITES

Objectives

- Design of materials based vehicular hydrogen storage systems that will allow for a driving range of greater than 300 miles
- H₂ storage system focus:
 - Metal hydride
 - Chemical hydride
 - H₂ cryo-sorption materials

Target examples:

Performance Measure	Units	2010	2015	Ultimate	
System Gravimetric Capacity	g H ₂ /kg system	45	55	75	
System Volumetric Capacity	g H ₂ /L system	28	40	70	
System fill time (for 5 kg H ₂)	minutes	4.2 3.3		2.5	
Fuel Purity	% H ₂	SAE J2719 guideline (99.97% dry basis)			

Approach

Leverage in-house expertise in various engineering disciplines and prior experience with metal hydride system prototyping to advance materials based H₂ storage for automotive applications

Material

Vehicle Viability System Safety: Modeling and Risk Development Assessment Advanced HX/bed Model H₂ Purity HX/bed Design Development Material Material **Transport** Compaction **Properties and Kinetics**

Month/Year	Go/No-Go Decision
Apr-11	Provide a system model for each material sub-class (metal hydrides, adsorption, chemical storage) which shows:
	 4 of the DOE 2010 system storage targets are fully met
	Status of the remaining targets must be at least 40% of the target or higher

Development Assessment

HX-bed Modal Development Hx-bed Design H2-Purity

Material Properties and Kinetics Compaction Tansport

 Objective: Optimization of hydrogen storage system heat exchanger for fast refueling time

Approach:

- Co-developed and validated COMSOL™ model of NaAlH₄ bed with SRNL
- Incorporated improved material properties after compaction (p, k)
- Performed parametric study to optimize heat exchanger design for fast refueling time
- Developed lumped parameter model for System Level Modeling

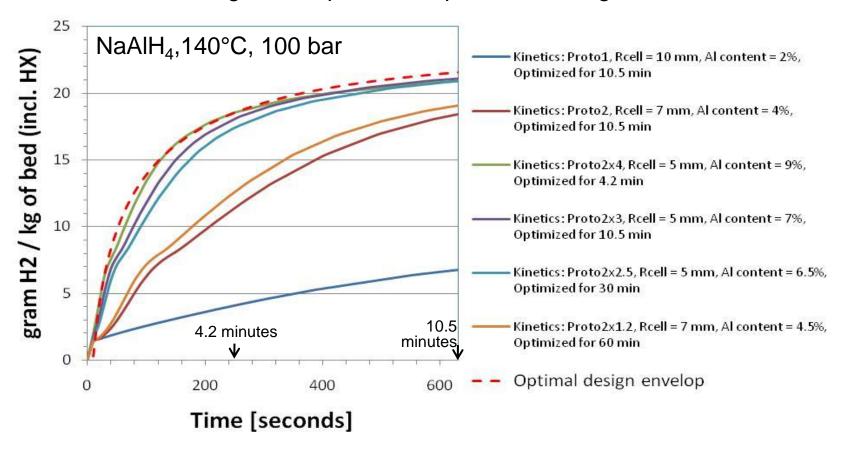

HX Design for Fast Refueling Time

HX/bed Model Development Advanced Development Hz/bed Design Hz purity Development Material Material Material Transport

Different bed designs are optimal for specific refueling times

NaAlH₄ is a good model material for designing engineering tools but can not achieve gravimetric capacity targets at fast refueling times

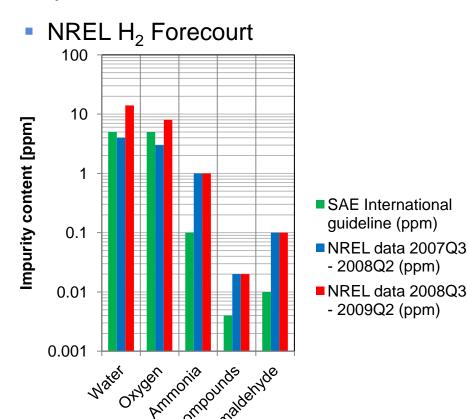

H₂ Purity

 Objective: Develop system methods to improve discharged hydrogen purity / quality for acceptable PEM fuel cell durability

Impurities of Concern:

Based on HSECoE Tier 1 & 2 Materials

Storage material	Impurity	SAE guideline	HSECoE Estimate
Ammonia Borane	Borazine	???	0.4-3.0%*
	Diborane	???	1-5 ppm
	Ammonia	0.1 ppm	20-200 ppm
Metal Amides	Ammonia	0.1 ppm	200-800 ppm

*LANL: 0.01-0.08 mol Borazine/ mole of AB reacted

Initial focus on Ammonia

US06

NaAlH₄ system example:

- Power demand curves from HSSIM (NREL)
- Lumped heat transfer model parameters from COMSOL™ model of NaAlH₄ bed
- Single "cold start" from 20°C:
 - H₂ stored in free volume is burned to raise temperature
- Drive cycle repeats indefinitely
 - Drive cycles were not designed for vehicles with materials based H₂ storage systems
- Minimum delivery pressure: P_{min}= 3 bar
- Results show drive cycle is tracked correctly until after 5kg H₂ have been delivered to the fuel cell.
- More details in presentation by GM

Performance comparison of all three hydrogen storage systems on a common basis

FY10 and FY11 Plan

	FY10		FY11		
	3Q	4Q	1Q	2Q	3Q
Improve properties through compaction with reinforcing material		•			
Quantify impact of pressure gradients inside consolidated metal hydride powder on H ₂ absorption and desorption kinetics					
Evaluate small test article with structured media					
Evaluate alternative reversible metal hydride materials in common H ₂ storage framework with current engineering tools					
Improve capacity of on-board H ₂ purification cartridge for ammonia					
Develop and assess methods for removing boron containing species		_			
Qualitative risk assessments of novel systems					_
Improve definition of Balance of Plant (BOP) components in system model and establish a common bill of materials	_				
Implement initial cost model library for storage systems		_			
Identify technology gaps and prioritize concepts	_				
Quantify hydrogen storage system performance against DOE targets for Go/No-Go decision on April 30, 2011					$\stackrel{\wedge}{\Longrightarrow}$

Summary

Relevance: Design of materials based vehicular hydrogen storage systems that

will allow for a driving range of greater than 300 miles

Approach: Leverage in-house expertise in various engineering disciplines and

prior experience with metal hydride system prototyping to advance

materials based H₂ storage for automotive applications

Technical Accomplishments and Progress:

 Developed method that improved volumetric capacity and thermal conductivity through compaction

- NaAlH₄ is a good model materials but can not achieve gravimetric capacity targets at fast refueling times
- Hydrogen purification cartridge for adsorbing NH₃ appears viable
- Established Simulink framework that enables performance comparison of all three hydrogen storage materials against DOE targets on a common basis

Collaboration: Active collaboration with all partners in center, for instance between

Ford, GM, PNNL and NREL on system level modeling

Future Work: Work towards milestones on quad charts of each of the technical

areas and technical teams and towards Go/No-Go decision on April

30, 2011
